Array of Object

Create array of objects

Class_name [] objArray;

- **Alternatively, you can also declare an Array of Objects as shown below:**

Class_nameobjArray[];

Declare and instantiate array of object

```
Employee[] empObjects = new Employee[2];
```

Example program to initialize array of objects

```
class Main{
   public static void main(String args[]){
     //create array of employee object
    Employee[] obj = new Employee[2] ;

     //create & initialize actual employee objects using constructor
     obj[0] = new Employee(100,"ABC");
     obj[1] = new Employee(200,"XYZ");

     //display the employee object data
     System.out.println("Employee Object 1:");
     obj[0].showData();
     System.out.println("Employee Object 2:");
     obj[1].showData();
  }
}
//Employee class with empId and name as attributes
class Employee{
  int empId;
  String name;
  //Employee class constructor
  Employee(inteid, String n){
     empId = eid;
     name = n;
  }
public void showData(){
   System.out.print("EmpId = "+empId + "   " + " Employee Name = "+name);
   System.out.println();
 }
}
```
