What is a Stream?

- Path along which the data flows

What is a Stream?

- Linked to a physical layer by java I/O system to make input and output operation

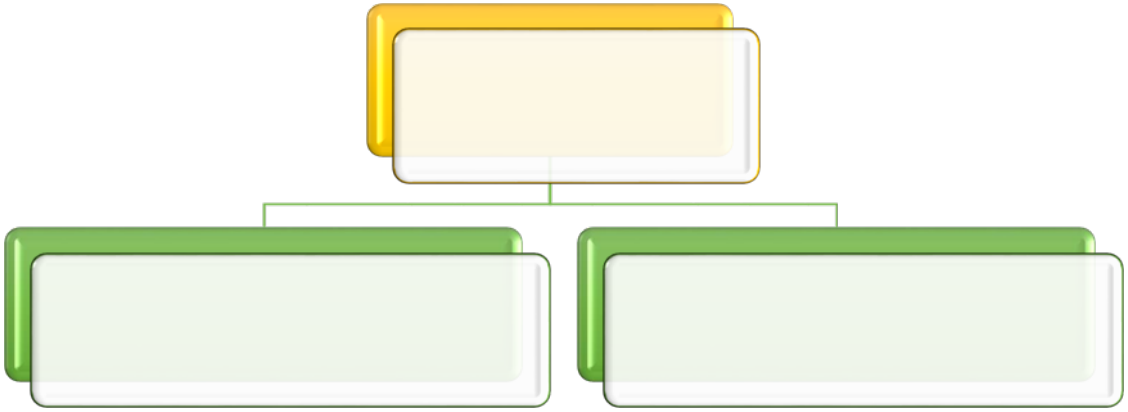

Types of stream :

- Stream
- Byte Stream
- Character Stream
- Java encapsulates Stream under java.io package
- Perform input and output of 8-bit bytes
- Perform input and output for 16-bit unicode

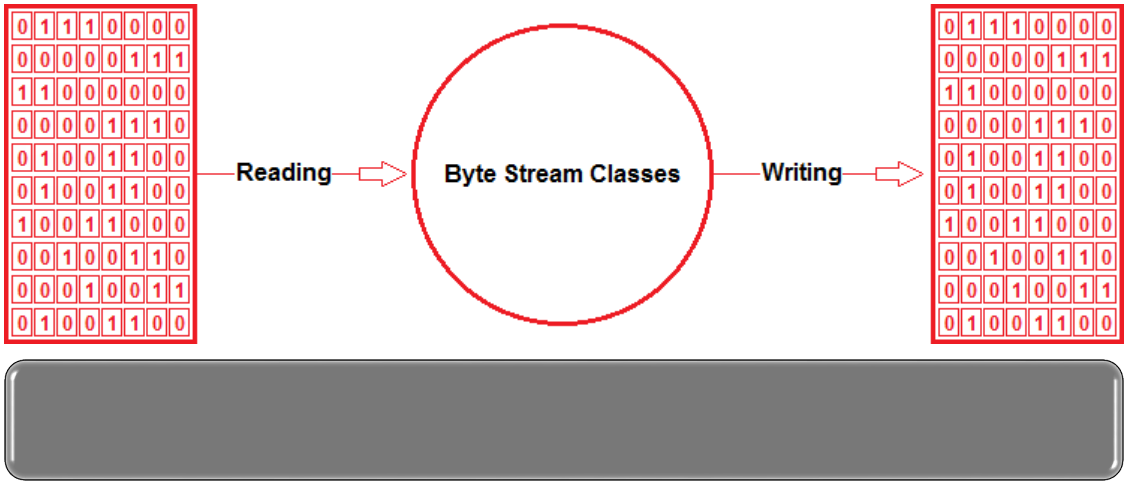

Types of stream :

- Stream
- Input Stream
- Output Stream

Byte stream :

- Have several concrete classes that handle various devices such as disk
- files, network connection etc.

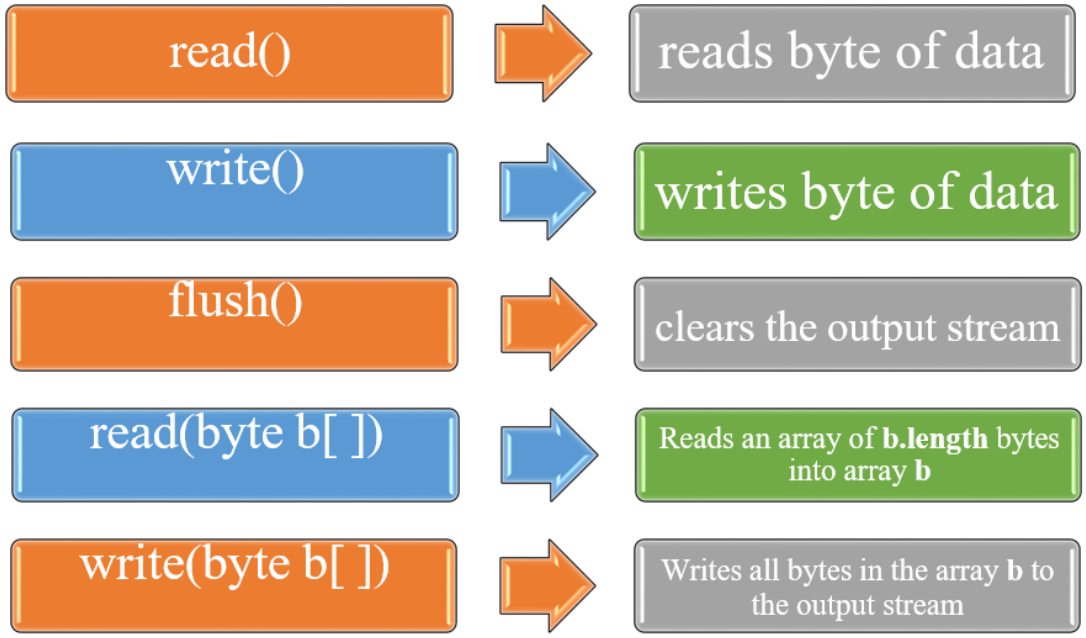

Byte stream types :

- InputStream and OutputStream are abstract class and therefore we cannot create instances

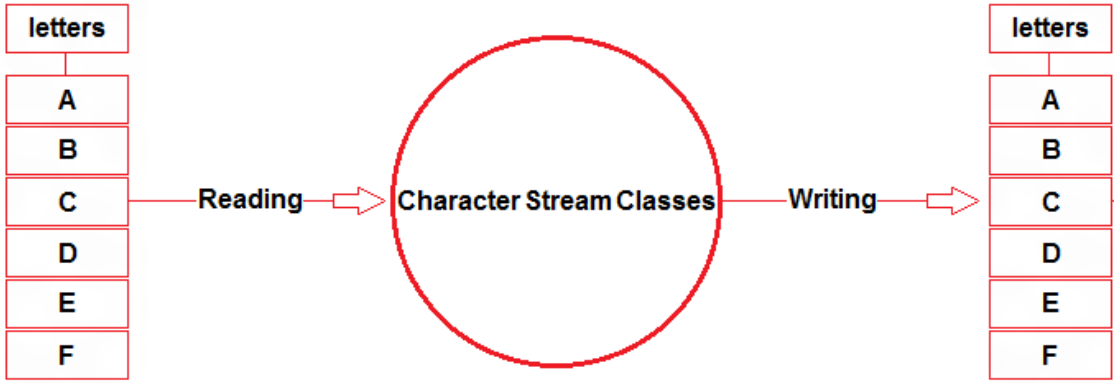

Byte stream subclasses :

Important methods:

Character stream:

- Have several concrete classes that handle Unicode character

character stream types :

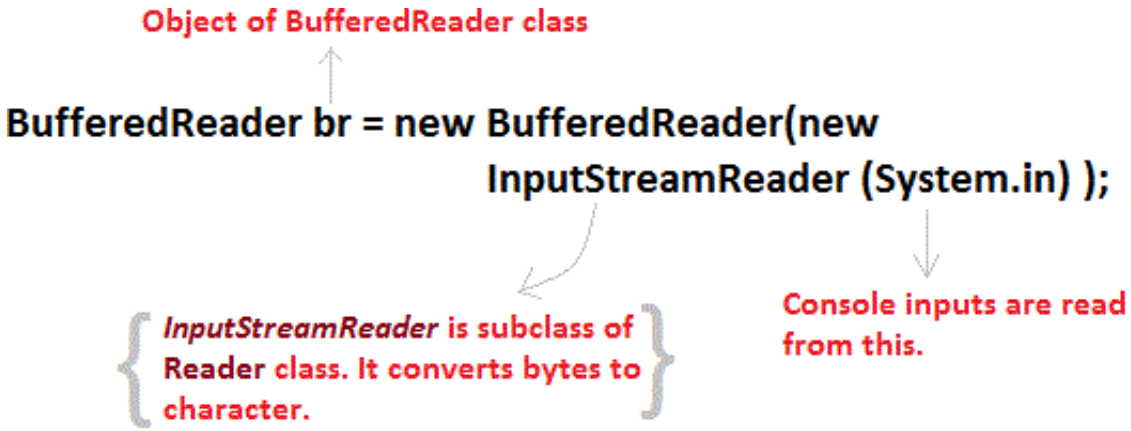

Only difference is that while byte stream classes are designed to read and write bytes, the character stream classes are designed to read and write character

character stream classes :

Ways to read from console :

Using scanner :

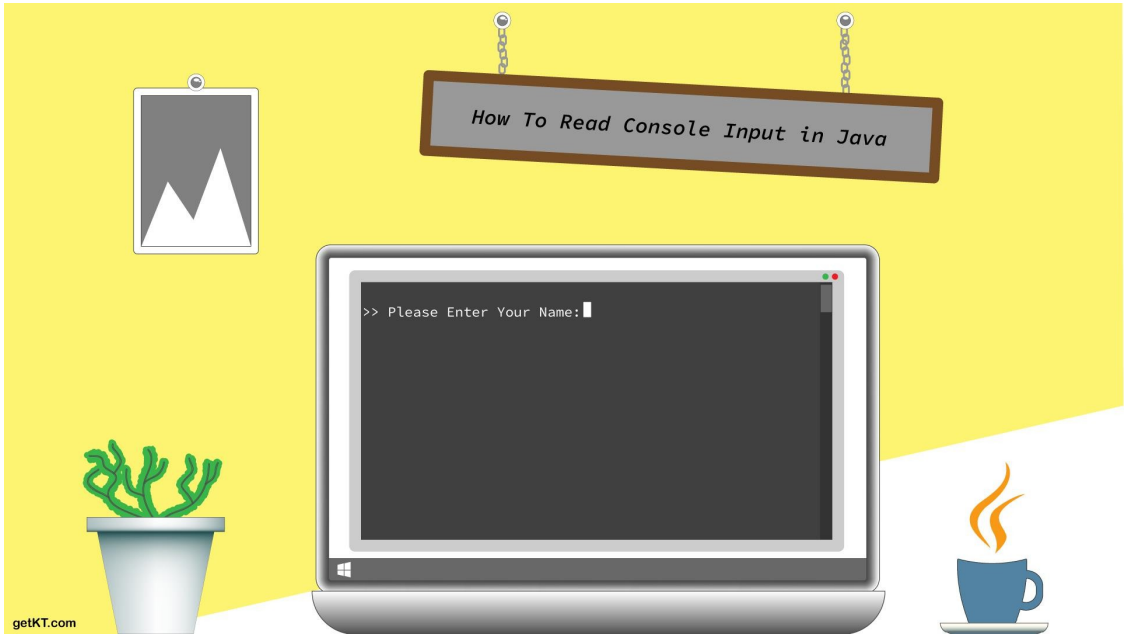

Using bufferedreader :

example:

- Reading and Writing One Character at a time
- https://onlinegdb.com/Hy2er3AIw
- Reading and Writing one line at a time
- https://onlinegdb.com/B1hlw308D

Using console:

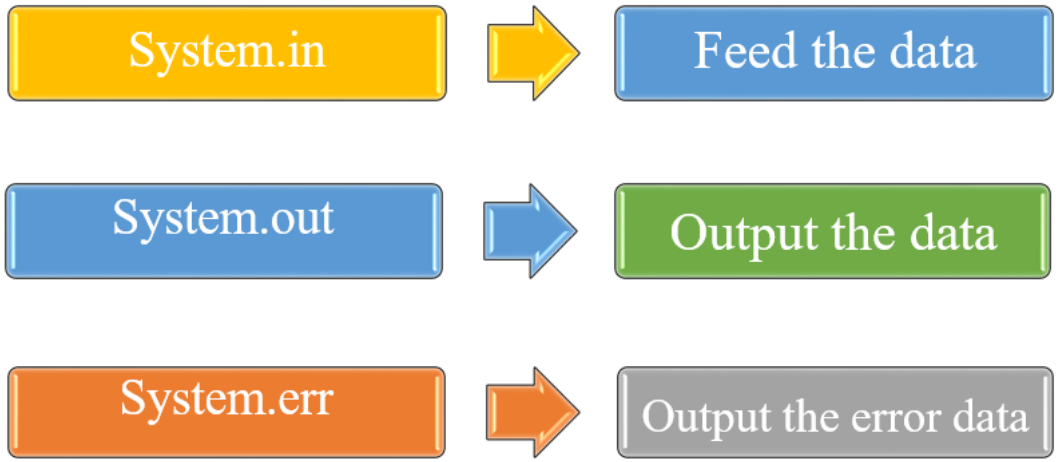

console class methods:

examples:

- Program to take input from user using the Console class:
- https://onlinegdb.com/HJ56Yh6Uw
- To read password from user using the Console class:
- https://onlinegdb.com/BkOh3na8v

Standard streams:

Hands – On Practice

Any Queries ? Thank You!
